This sequence represents the hydrophobic domain containing protein, clone HP00631 nucleotide sequence. The sequence is isolated from a human stoned cancer cell line. The HP02433 protein contains one putative transmembrane domain. The protein shows homology to the japanese quail apoptosis regulator NR-13. The invention relates to human proteins with hydrophobic domains, the DNA and the CDNA encoding them. The proteins are predicted to have biological activities of polymucleotides and proteins are predicted to have biological activities which make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. Suggested activities include conditions in humans and animals. Suggested activities include coll proliferation/differentiation activity; immune stimulating (e.g. or vaccines) or suppressing activity (e.g. to treat various immune collupus erythematosus, rheumatoid activity; autoimmune pulmonary collupus erythematosus, rheumatoid arthritis, autoimmune thyroiditis insulin dependent diabetes mellituus myasthenia garvis, graft-versus-host disease and autoimmune inflammatory eye disease, as well as asthma, allergies and corgan transplantation); haemacopolesis regulating activity (e.g. in treatment of myeloid or lymphoid cell deficiencies); tissue growth
                                                                                                                                                                                                 589

Novel human proteins having hydrophobic domains used for research and diagnostic purposes

Claim 3; Page 84; 117pp; English

This sequence represents the hydrophobic domain containing protein, clone HP00631 coding region. The sequence is isolated from a human stomach cancer cell line. The HP02403 protein contains one putative transmembrane domain. The protein shows homology to the japanese quail apoptosis commans, the DNA and the cDNA encoding them. The polynuclectides and proteins are predicted to have biological activities which make them proteins are predicted to have biological activities which make them contains and animals. Suggested activities include mutritional activity (nutritional source or supplement); cytokine and cell conditions in proliferation/differentiation activity; immune stimulating (e.g. as vaccines) or supplement); cytokine and cell incommune such animals. Suggested activities include mutritional activity (inflammation; cupplement); cytokine and cell incoming such as SCIDS or HIV, connective tissue disease, systemic deficiencies such as SCIDS or HIV, connective tissue disease, systemic containment of such as SCIDS or HIV, connective tissue disease, systemic dependent diabetes mellitus, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease, as well as asthma, allergies and crivity (e.g. wound healing and issue repair, ulcers, burns, periodontal disease); activity individual activity; chemotactic/chemokinetic activity; degrament of myelod or lymphoid cell deficiencies); tissue growth activity; haemostatic and thrombolytic activity; chemotactic/chemokinetic activity; activity; heamostatic and thrombolytic activity; chemotacticy chemotacticy chemotacticis activity; activity; heamostatic and thrombolytic activity; chemotacticy chemotacticis cused by becteria, fungi, viruses and other parasites (e.g. Hepsinia); effecting biochlythms or caricadic cycles; enhancing fertility; shin, effecting biochlythms or caricadic cycles; enhancing fertility; skin, effecting biochlythms or caricadic cycles; enhancing derived activity, the proper in the polymucleotides may also be used for recombinant ex the protein

The invention provides nucleic acid molecules (NAM1) encoding 4 human Bc1

2-like polypeptides (PEP1). The NAM1 and PEP1 may be used in the prevention, diagnosis and treatment of diseases associated with the prevention, diagnosis and treatment of diseases associated with the prevention, diagnosis and treatment of diseases associated with the comportate Bc1-2-like polypeptides "expression. The NAM1 may be used to produce the Soluble Bc1-2-like polypeptides by standard recombinant composition of antibodies against Bc1-2 and in assays to identify compositions of Bc1-2 expression and activity. The anti-Bc1-2 antibodies and antagonists may be used to down regulate expression and activity. The anti-PEP1 antibodies may also be used as diagnostic agents for detecting the presence of Bc1-2 polyps in samples (e.g. by enzyme linked compositions assay (Elish)). Disorders that may be prevented, diagnosed and/or treated by the above methods include, immunodeficiencies (e.g. autoimmune gammaglobulinemia and B cell lymphoproliferative disorder), altergic creactions, antilammations, respiratory diseases and cardiovascular disorders (afficient sequence represents a human Bc1-2-like polypeptide encoding cDNA). Present sequence represents a human Bc1-2-like polypeptide encoding cDNA
                                                                                            Nucleic acids encoding human Bc1-2-like polypeptides, useful preventing, diagnosing and/or treating.
                                                                                                                                             Claim 1; Page 276; 285pp; English

                                                                                                                                                                                                                                                       The present invention relates to the isolation of novel human connective tissue related polypeptides (AAUS6435-AAUS6923) and the polymucleotide (CDNA and ganomic) sequences encoding them. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of diseases associated with connective tissue(s), including cancer. The polymucleotide sequences of the invention are also useful in gene therapy, ABK41613-ABK42101 represent CDNA sequences encoding the novel human connective tissue related polypeptides. Note: The sequence was obtained in electronic format directly from WIPO at they but human directly from WIPO at
                                                                                                                                                                                         Nucleic acid encoding novel connective tissue associated polypeptides, used in diagnosing, preventing, treating or ameliorating a disorder such as cancer or rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           155 AlaTrpLeuGlnAlaGlnGlyGlyTrpAspClyPheCysHisPheArgThrProPhe

```

The invention describes an isolated nucleic acid molecule (I), which comprises a sequence that is at least 95 % identical to a connective tissue—related polymucleotide encoding connective tissue antigens (CTA).

The polymetride or polymucleotide is useful for preventing, treating, or ameliorating medical conditions in a mammal. The connective tissue to polymptides, polymucleotides and antibodises are particularly useful for treating, preventing and/or prognosing disorders of connective tissues (e.g. rheumatoid arthritis, discoid and systemic lupus erythematosus, colect metastases and/or neoplasias (e.g. leukaemia), neurodegenerative disorders (e.g. Alzheimer's disease, or Parkinson's disease), cardiovascular diseases (e.g. atherosolerosis, mycocarditis or cardiopulmonary bypass complications), autoimmune diseases (e.g. systemic lupus erythematosus, theumatoid arthritis, or multiple sclerosis), allergic reactions (e.g. Length: Matches: Conservative: Mismatches: Indels: 2.47e-53 639.00 97.69% 97.69% 88.95% Percent Similarity: Best Local Similarity: Query Match: DB: Alignment Scores: Pred. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with a least one member, of oligonuclectides and/or peptide-nucleic acid (NNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of therapeutic drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Determining the degree of cytosine methylation in genomic DNA, useful fo diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA.

and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting-mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ13410-ABQ34121 represent genomic DNA sequences used to illustrate the method disclosure of the invention

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic ornor is hypridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used:

(i) for diagnosis and/or prognosis of side effects of therapeutic drugs and or a vide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP) s); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. AB013410-AB04121 represent genomic DNA sequences used to illustrate the method in the disclosure of the invention
                                                                                                                                                                                                                                                                       Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA.

This invention describes a novel method for determining the degree or methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonuclectides and/or peptide-nucleic acid (PNA) oligoners and the complicon. From the ratio of labels hybridised to the two classes of coligoners, the degree of methylation is calculated. The method is used: (C) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (C) SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABO13410-ABQ54121 represent genomic DNA sequences used to illustrate the metion for determining the degree of cytosine methylation described in the disclosure of the invention

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a gentylation of a particular cytosine in a motif 5'-CpG-3', present in a gentylation of sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic cytosine (C) but not methylated C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the run of the range of methylation is calculated. The method is used:

(1) for diagnosis and/or prognosis of side effects of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNPP); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ13410-

C ABQ54121 represent genomic DNA sequences used to illustrate the method in the disclosure of the invention
                                             uetermining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Arceceearrreingererrrrearrachrrecerrrarrrecerrachererere 427
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TrpGlyPheGlnProArgLeuLysGluGlnGluGlyAspValAlaArgAspCysGlnArg 140
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   307

The invention relates to a novel array comprising at least two isolated nucleotide molecules, each molecule having a sequence capable of uniquely districtsing to a nucleic acid molecule which is an expression product of a gene involved in mitochondrial blology. The array comprises two or more isolated nucleic acid molecules or spots, each molecule having a sequence chosen from sequence of 994 human probes and 2046 mouse probes. An array conserved in the invention is useful for determining an expression profile of a mouse or human sample containing nucleic acid, by contacting the array with the sample under conditions allowing selective whybridisation, and measuring hybridisation of nucleic acid in the sample to the array to produce an expression profile of a first labelled sample containing nucleic acid an expression profile of a first labelled sample containing nucleic acid. The second sample is a reference or a stendard. An array is useful for determining an expression profile diagnostic of an energy-metabolism-related physiological condition. An array of the invention is useful for determining mitochondrial biology gene expression profiles of organisms, which are useful for determining expression profiles diagnostic of energy metabolism-leated physiological conditions, which are useful for preventing expression profiles diagnostic of energy metabolism-leated physiological conditions, evaluating and/or menaples, and mutations involved in such physiological conditions, evaluating and/or monitoring the efficacy of such theraples, and creating and identifying animal models of human energy metabolism-related physiological conditions, evaluating and/or monitoring the efficacy of such theraples, and mutations involved in such physiological conditions, evaluating and/or monitoring the efficacy of such theraples, and creating and identifying animal models of human energy metabolism-related physiological conditions, evaluating animal models of human energy physiological and diseases, as well as distinguishing clinical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Array containing probes for genes involved in mitochondrial biology, useful for determining mitochondrial biology gene expression profiles for use in diagnosing pathologies and identifying biochemical pathways.

The invention relates to a novel array comprising at least two isolated nuclectide molecules, each molecule having a sequence capable of uniquely hybridising to a nucleica acid molecule which is an expression product of a gene involved in mitochondrial biology. The array comprises two or more consens in the companies of spots, each molecule having a sequence chosen from sequence of 994 human probes and 2046 mouse probes. An array consen from sequence of 994 human probes and 2046 mouse probles. An array consens or human sample containing mucleic acid, by contacting the array with the sample under conditions allowing selective hybridisation, and measuring hybridisation of nucleic acid, by contacting the array vertice of an expression profile. The array is also useful for determining an expression profile diagnostic of an energy-metabolism. Contacting mitochondrial biology gene expression profiles diagnostic of an energy-metabolism. The second sample to the invention is useful for acid. The second sample to the invention is useful for determining mitochondrial biology gene expression profiles of organisms, confastion and closaly related species, tissue and organs of such as human, mice and closaly related species, tissue and organs of such organisms, which are useful for determining expression profiles of used organs of all agnosing such physiological conditions, identifying biochemical conditions, identifying photomical conditions, dentifying pained physiological conditions, each manned and conditions, and creating and identifying animal models of human contacting the physiological conditions, each threaples, and creating and identifying animal models of human contacting the physiological conditions, evaluating and identifying animal models of human contacting to the invention contacting the physiological conditions, evaluating and identifying animal models of human and physiological conditions, evaluating and identifying animal models of human and physiological conditions. An array is also concaptures shown in A
                                                                                                                                                                                                                                                                                                                                                               Array containing probes for genes involved in mitochondrial biology, useful for determining mitochondrial biology gene expression profiles for use in diagnosing pathologies and identifying biochemical pathways.
                                                                                                                                                                                                                                                                            Kerstann K, Procaccio V;

The invention relates to a novel array comprising at least two isolated nucleotide molecules, each molecule having a sequence capable of uniquely hybridising to a nucleic acid molecule which is an expression product of a gene involved in mitochondrial biology. The array comprises two or more isolated nucleic acid molecules or spots, each molecule having a sequence cheep from sequence of 994 human probes and 2046 mouse probes. An array of the invention is useful for determining an expression profile of a mouse or human sample containing nucleic acid, by contacting the array with the sample under conditions allowing selective hybridisation. and measuring hybridisation of nucleic acid in the sample to the array to produce an expression profile. The array is also useful for determining an expression profile of a first labelled sample containing nucleic acid. The second sample is a reference or a stendard. An array is useful for determining an expression profile diagnostic of an energy-metabolism-

related physiological condition. An array of the invention is useful for determining mitochondrial biology gene expression profiles of organisms, such as human, mice and closely related species, tissue and organs of such organisms, which are useful for determining expression profiles diagnostic of energy metabolism-related physiological conditions, identifying biochemical pathways, genes, and mutation involved in such physiological conditions, identifying therapeutic agents useful for preventing and/or treating such physiological conditions, evaluating and/or monitoring the efficacy of such therapies, and creating and dentifying animal models of human energy metabolism-related physiological conditions, and all dentifying animal models of human useful for defining expression signatures or profiles for mitochondrial diseases, as well as distinguishing clinical disorders that result from expressions signatures or profiles for mitochondrial contributions. An array of the invention contains probes of genes not previously recognised to participate in mitochondrial biology. The sequences shown in ADD3224-ADD35260 represent murine mitochondrial DNA clones used to make the probes of the invention. Some sequences are not present, these are SEQ ID NO's 295, 1174, 1213, 1700, 1728, 1730, 1905,

agent comprising determining the expression of a rat toxic response gene (s) in the test animal in response to the agent. The method is useful in drug development, particularly for conducting toxicity studies and analysis before a new drug or compound is approved for human consumption or use. The method is also useful in determining toxicological responses to a new drug. This polynucleotide sequence represents a phase-1 rat CT gene of the invention
                                                                                                                                                                                                                                        of an

```
The invention relates to a novel method for predicting the liver toxicity of an agent to an individual comprising obtaining a biological sample from an individual treated with the agent, measuring the expression of one or more liver toxicity predictive genes in the sample and using the test expression profile with a set of reference expression profiles in a predictive model to determine whether the agent will reduce liver toxicity in the individual. The method of the invention may be useful for sequence is that of the liver toxicity of an agent to an individual. The current sequence is that of the liver toxicity predictive DNA of the invention which represents a 24 hour combo All gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Predicting the liver toxicity of an agent to an individual by using the test expression profile with a set of reference expression profiles in a Predictive Model to determine whether the agent will reduce liver toxicity in the individual.

* NOTE: This record contains 192 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
* be preserved.

* sequencing reads that have not been assembled into
* contiggs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
* be preserved.

                                                                                                                                                                   Submitted (105-JUN-2003) Wellcome Trust Sanger Institute, Hinxton, Cambridgeshire, CB10 15A, UK. E-mail enquiries:
Consequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.
The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:
Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORNPEP; Information on the WORNPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep CTB-1191B2 is from the human BAC library described in U-J. Kim et al. (1996)
Genomics 34, 213-218.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence was finished as follows unless otherwise noted; all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (1.e., phred quality; >= 30), an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

This sequence was generated from part of bacterial clone contigs of human chromosome 22, constructed by the Sanger Centre Chromosome 22 hupping Group. Further information can be found at the ps./Www.sanger.ac.uk/HGP/Chr22 important This sequence is not the entire insert of clone CTB-1191B2 It may be shorter because we sequence overlapping sections only once, except for a short overlap. The true left end of clone CTB-1191B2 is at 1 in this sequence. The true right end of clone RTB-1191B2 is at 1 in this sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /noce="MIR repeat: matches 110. .158 of consensus"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                    The invention relates to human member of Bcl-2 family Bcl-B protein and its corresponding nucleic acid. Bcl-B is useful in treating a subject having or at risk of a disorder associated with apptrosis, such as cell degenerative or proliferative disorder like neural or muscle degeneration, e.g. Alzheimer's disease, Creutzfeldt-Jacob's disease (CJD), Machado-Oseph disease (MJD), Parkinson's disease, Huntington's disease (HD), spinocerebellar ataxias 1, 2 and 6 (SCA-1, -2 and -6), dentarorubropallidoluysian atrophy (DRPLA), Kennedy's disease, stroke, ischaemia, head trauma, neoplasia, autoimmune disorder or fibrotic condition. The transgenic animals are used as in vivo models to study apoptosis and potential therapies for apoptosis. The present sequence is human Bcl-B DNA. Bcl-B gene is located at chromosome 15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CGACTACCTGGGGTACTGCGCCCGGGAACCCGGGCACCCCCGAGCCGGCGCGTATCCACGCC

This sequence represents the hydrophobic domain containing protein, clone HP00631 nucleotide sequence. The sequence is isolated from a human stoomach cancer cell line. The HP02409 protein contains one putative transmembrane domain. The HP02409 proteins one putative transmembrane domain. The protein shows homology to the japanese quail apoptosis regualtor NR-13. The invention relates to human proteins with hydrophobic domains, the DNA and the CDNA encoding them. The polynucleotides and proteins are predicted to have biological activities polynucleotides and proteins are predicted to have biological activities of untritional activity (nutritional source or supplement); cytokine and cell proliferation/differantiation activity; immune stimulating (e.g. or untritional activity (nutritional activity; immune stimulating (e.g. vaccines) or suppressing activity (e.g. to treat various immune cell proliferation/differantiation activity; immune pulmonary inflammation, Guillain-Barre syndrome, autoimmune pulmonary inflammation, Guillain-Barre syndrome, autoimmune thyroiditis, insulin dependent diabetes mellitut, mysethenia gravis, graft-versus-host disease corpan transplantation); haematopoiesis regulating activity (e.g. in treatment of myeloid or lymphoid cell deficiencies); tissue growth certivity (e.g. wound healing and issue repair, ulcers, burns, pariodontal disease); activity; chemotactic/chemokinetic activity, haemostatic and thrombolytic activity (e.g. treating

haemophilias); receptor/ligand activity; anti-inflammatory activity; and tumour inhibition activity. The polymucleotides are also stated to be useful for gene therapy. Other activities include inhibiting infections caused by bacteria, fungi, viruses and other parasites (e.g. Hepatitis, malaria); effecting bodily characteristics such as, e.g. weight, colour, skin, effecting biorhythms or caricadic cycles, enhancing fertility; treatment of depression; teamment of pain, hormonal or endocrine activity. The polynucleotides may also be used for recombinant expression

This sequence represents the hydrophobic domain containing protein, clone HP00631 coding region. The sequence is isolated from a human stomach cancer cell line. The HP02403 protein contains one putative transmembrane domain. The protein shows homology to the japanese quail apoptosis comman. The protein shows homology to the japanese quail apoptosis comman. The protein shows homology to the japanese quail apoptosis requaltor NR-13. The invention relates to human proteins with hydrophobic domains, the DNA and the CDNA encoding them. The polymuclectides and proteins are predicted to have biological activities which make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. Suggested activity; immune stimulating (e.g. as vacines) or suppressing activity; immune stimulating (e.g. as vacines) or suppressing activity; immune stimulating activity (nutritional source or supplement); cytokine and cell immune coll deficiencies such as SCIDS or HIV, connective tissue disease, systemic lupus sythematosus, rheumatoid arthritis, autoimmune pulmonary inflammation, Guillain-Barre syndrome, autoimmune pulmonary inflammation, Guillain-Barre syndrome, autoimmune pulmonary condition, Guillain-Barre syndrome, autoimmune pulmonary inflammation, Guillain-Barre syndrome, autoimmune pulmonary inflammation, Guillain-Barre syndrome, autoimmune pulmonary inflammation, Guillain-Barre syndrome, autoimmune pulmonary inflammation); heamatopoiesis regulating activity; e.g. mound healing an expairing activity; chemocactic/chemokinetic activity; heamostatic and thrombolytic activity; chemocactic/chemokinetic periodontal disease); activin/Alnhibin activity; chemocactic/chemokinetic activity; heamostatic and thrombolytic activity; chemocactic/chemokinetic setulity, heamostatic and thrombolytic activity; chemocactic/chemokinetic caused by bacteria, fungi, viruses and other parasites (e.g. weight, colour, skin, effecting bodily characteristics such as a well as a setulity; tradment of depression; treatment o of the protein

Sequence 582 BP; 85 A; 193 C; 191 G; 113 T; 0 U; 0 Other;

The invention provides nucleic acid molecules (NAMI) encoding 4 human Bcl -2-like polypeptides (PEP1). The NAMI and PEP1 may be used in the prevention, diagnosis and treatment of diseases associated with compropriate Bcl-2-like polypeptides expression. The NAMI may be used to produce the soluble Bcl-2-like polypeptides by standard recombinant comproducing the polypeptides may also be used as antigens in the production of antibodies against Bcl-2 and in assays to identify modulators of Bcl-2 expression and activity. The anti-Bcl-2 antibodies and antagonists may be used to down regulate expression and activity. The anti-PEP1 antibodies may also be used as diagnostic agents for detecting the presence of Bcl-2 polyPs in samples (e.g. by enzyme linked immunosorbant assay (BLISA). Disorders that may be prevented, diagnosed immunosorbant assay (BLISA). Disorders that may be prevented, diagnosed and/or treated by the above methods include, immunodeficiencies (e.g. a gammaglobulinemia and B cell lymphoproliferative disorder), autoimmune disorders (e.g. rheumatoid arthritis and Grave's disease), allergic reactions, inflammations, respiratory diseases and cardiovascular disorders (a full list of disorders is given in the specification). The present sequence represents a human Bcl-2-like polypeptide encoding cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 749

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     503
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    384 regagadadacaecregrecaegerriricreretarecrierraacaacaecerrearrana 443
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to the isolation of novel human connective tissue related polypeptides (AAU66435-AAU66923) and the polymucleotide (CDNA and genomic) sequences encoding them. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of diseases associated with connective tissue(s), including ender. The polymucleotide sequences of the invention are also useful in gene therapy. ABK41613-ABK42101 represent CDNA sequences encoding the novel human connective tissue related polypeptides. Note: The sequence was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid encoding novel connective tissue associated polypeptides, used in diagnosing, preventing, treating or ameliorating a disorder such as cancer or rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GCTCAGGGCGGCTGGATGGCTTTTGTCACTTCTTCAGGACCCCCTTTCCACGGCTTTT

The invention describes an isolated nucleic acid molecule (I), which comparises a sequence that is at least 95 % identical to a connective tissue-related polynucleotide encoding connective tissue antigens (CTA).

The polypeptide or polynucleotide is useful for preventing, treating, or mealiorating medical conditions in a mammal. The connective tissue polypeptides, polynucleotides and antibodies are particularly useful for treating, preventing and/or prognosing disorders of connective tissues (e.g. rheumatoid arthritis, discoid and systemic lupus erythematosus, colerand, or Sjogran's syndrome), cancers, cancer metastesse and/or neoplasias (e.g. leukaemia), neurodegenerative disorders (e.g. neoplasias (e.g. leukaemia), neurodegenerative disorders (e.g. atherosclerosis, myocarditis or cardiopulmonary bypass complications), autoimmune diseases (e.g. systemic lupus erythematosus, rheumatoid arthritis, or multiple sclerosis), allergic reactions (e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New connective tissue-related polypeptides and polynucleotides, useful for treating, preventing and/or prognosing e.g. disorders of connective tissue, (e.g. rheumatoid arthritis), cancers, cancer metastases and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GCTCAGGGCGGCTGGGATGGCTTTTGTCACTTCTTCAGGACCCCCTTTCCACGGCTTTTT

The invention relates to human member of Bcl-2 family Bcl-B protein and its corresponding nucleic acid. Bcl-B is useful in treating a subject having or at risk of a disorder associated with apoptosis, such as cell degenerative or proliferative disorder like neural or muscle degeneration, e.g. Alzheimer's disease, Creutzfeldt-Jacob's disease (CDD), Machado-Joseph disease (MDD), Parkinson's disease, Huntington's disease (HD), spinocerebellar ataxias 1, 2 and 6 (SCA-1, -2 and -6), dentacorubropallidoluysian atrophy (DRPLA), Kennedy's disease, stroke, ischammia, head trauma, neoplasia, autoimmune disorder or fibrolic condition. The transgenic animals are used as in vivo models to study apoptosis and potential theraphas for apoptosis. The present sequence is a reverse transcription (RT)-PCR primer used for cloning human BCl-B GDA).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated or recombinant Bcl-B nucleic acids and polypeptides, for treating a disorder associated with apoptosis, such as cell degenerative or proliferative disorder e.g. cancer, Alzheimer's disease or Parkinson's

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcribtome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises several coligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcription unit of the genome, which encodes one or more messenger RNA splice variants. The coligonucleotide libraries are useful for detecting mRNAs from a quantitatively characterising the corresponding transcriptome, and in detecting RNA transcripts on profiling studies, in qualitatively or capanitatively characterising the corresponding transcriptome, and in detecting RNA transcripts of a sub-transcriptome under a particular colibraries to detect transcripts of a sub-transcriptome under a particular colibraries to detect transcripts of a sub-transcriptome under a particular colibraries to detect transcripts of a sub-transcriptome under a particular colipogical or pathological state, and so allowing the detection of tissue colipogical transcriptome of a patient suffering from a particular coliscular aspecific genes; and to detect RNA transcripts and splice variants of a transcriptome of a patient suffering from a particular coliscular intention. N.B. The sequence data for this patent did not form a particular coliscular from united the principle of the principle o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    565 CCCTTTCCACTGGCTTTTTGGAGAAAACAGCTGGTCCAGGCTTTTCTGTCATGCTTGTT 624
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 CCCCTTTCCACTGGCTTTTTGGAGAAAACAGCTGGTCCAGGCTTTTTCTGTCATGCTTGTT 60

The invention relates to human member of Bcl-2 family Bcl-B protein and its corresponding nucleic acid. Bcl-B is useful in treating a subject having or at risk of a disorder associated with approxis, such as cell degenerative or proliferative disorder like neural or muscle degeneration, e.g. Alzheimer's disease, Creutzfeldt-Jacob's disease (CUD), Machado-Ososph disease (MD), Parkinson's disease, Huntington's disease (HD), spinocerebellar ataxias 1, 2 and 6 (SCA-1, -2 and -6), dentatorubzopallidoluysian atrophy (DRPLA), Kennedy's disease, stroke, ischaemia, head trauma, neoplasia, autoimmune disorder or fibrotic condition. The transgenic animals are used as in vivo models to study apoptosis and potential therapies for apoptosis. The present sequence is a reverse transcription (RT)-PCR primer used for cloning human Bcl-B cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated or recombinant Bcl-B nucleic acids and polypeptides, for treating a disorder associated with apoptosis, such as cell degenerative or proliferative disorder e.g. cancer, Alzheimer's disease or Parkinson's

Example 1; Page 48; 82pp; English.

The invention relates to human member of Bc1-2 family Bc1-B protein and its corresponding nucleic acid. Bc1-B is useful in treating a subject deaving or at risk of a disorder associated with approcase, such as cell degenerative or proliferative disorder like neural or muscle degeneration, e.g. Alzheimer's disease, Creutzfeldt-Jacob's disease (CJD), Machado-Joseph disease (MJD), Parkinson's disease, Huntington's disease (HD), spinocerebellar atrophy (DRPLA), Kennedy's disease, stroke, ischaemia, head transgenia atrophy (DRPLA), Kennedy's disease, stroke, condition. The transgenic animals are used as in vivo models to study appeticals and potential therapies'for appoticis: The present sequence is a reverse transcription (RT)-PCR primer used for amplifying human Bc1-B

New isolated or recombinant Bcl-B nucleic acids and polypeptides, for treating a disorder associated with apoptosis, such as cell degenerative or proliferative disorder e.g. cancer, Alzheimer's disease or Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human member of Bcl-2 family Bcl-B protein and its corresponding nucleic acid. Bcl-B is useful in treating a subject having or at risk of a disorder associated with apoptosis, such as cell degenerative or proliferative disorder like neural or muscle degeneration, e.g. Alzheimer's disease. Creutzfeldt-Jacob's disease (CLD), Machado-Ofseph disease (MDD), Parkinson's disease, Huntington's disease (HD), spinocerebellar ataxias 1, 2 and 6 (SCA-1, -2 and -6), dentatorubropallidoluysian atrophy (DRPLA), Kennedy's disease, stroke, ischaemia, head trauma, neoplasia, autoimmune disorder or fibrotic condition. The transgenic animals are used as in vivo models to study apoptosis and potential therapies for apoptosis. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, cytosine methylation; 5'-CpG-3'; uracil; cytosine; diagnosis; drug; side effect; cancer; central nervous system; cardiovascular; gastrointestinal; respiratory system; single nucleotide polymorphism; SNP; cell differentiation; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated or recombinant Bcl-B nucleic acids and polypeptides, for treating a disorder associated with apoptosis, such as cell degenerative or proliferative disorder e.g. cancer, Alzheimer's disease or Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to human member of Bc1-2 family Bc1-B protein and its corresponding nucleic acid. Bc1-B is useful in traating a subject having or at risk of a disorder associated with apoptosis, such as cell degenerative or proliferative disorder like neural or muscle degeneration, e.g. Alzheimer's disease, Creutzfeldt-Jacob's disease (CUD), Machado-Joseph disease (MUD), Parkinson's disease, Huntington's disease (HD), spinocerebellar ataxias 1, 2 and 6 (SCA-1, -2 and -6), dentarorubropallidoluysian atrophy (DRPLA), Kennedy's disease, stroke, ischaemia, head trauma, neoplasia, autoimmune disorder or fibrotic condition. The transgenic animals are used as in vivo models to study apoptosis and potential therapies for apoptosis. The present sequence is a PCR primer used for amplifying human Bc1-B DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; BC1-2; BC1-B; therapy; apoptosis; cell degenerative disorder; proliferative disorder; muscle degeneration; Alzheimer's disease; CUD; Creutzfeldt-Jacob's disease; Machado-Joseph disease; MUD; transgenic; Parkinson's disease; Huntington's disease; HD; spinocerebellar attaxia; SCA; dentatorubropallidoluysian atrophy; DRPLA; Kennedy's disease; stroke; ischaemia; head trauma; neoplassia; anticonvulsant; vulnerary; nootropic; neuroprotective; cytostatic; immunosuppressive; vasotropic; cerebroprotective; autoimmune disorder; PCR; primer; ss.

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic converts that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes; each with at least one member; of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of the capeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastroinestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation are considered to be determined simultaneously, ABQ13410-
Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ant genomic DNA sequences used to illustrate the method the degree of cytosine methylation described in the

Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons

```
This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5-769-3', present in a genomic sample of DNA. The sample is treated chemically to convert organization to the target of the sample is treated chemically to convert organization to the target of its analysis of the target of its amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridised to two classes; each with at least one member, of oligomic particular organization to both classes; each with at least one member, of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of therapputic drugs nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation. The method allows the methylation integration of status of many C residues to be determined simulanceously, ABO13410-ABO131121 represent genomic DNA sequences used to illustrate the method of the control of coll of the control of the contro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Genes and their expression products cloned from human cDNA libraries for

treatment and diagnosis of diseases associated with their expression. Claim 1(a); Page 63-66; 238pp; Japanese.

The invention relates to DNA encoding polypeptides directly cloned from companies originating in adult whole brain, human tonsil, human adult hippocampus and human foctal whole brain. Polypeptides and polymucleotides of the invention may be used in the investigation of differential expression of the DNA sequences in normal subjects and differential expression of the DNA sequences in normal subjects and disease patients. They may also be used in the production of antibodies, oligonucleotide probes and DNA chips for diagnosis and identification of autugs for treatment of diseases with which the DNA sequences are human gene sequences of the invention

BX119239 Soares infant brain 1NIB Homo sapiens CDNA clone
MAGE988N01170 ; IMAGE:40052, mRNA sequence.
Size-selected on agarose gel. Average insert size ~1kb. 5' Ahol site was destroyed after directional cloning.
Amplified once. Contact information: Hiroshi Inoue, MD, Metabolism Div. (Alan Permutt Lab); Washington University School of Medicine, Box 8127, 660 South Buclid Ave., St. Louis, MO 6310, E-mail: hinoue@imgate.wustl.edu, Tel: 314-362-1916, Fax: 314-747-2692."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /lab host="E. Coli strain XL10-Gold, T1-resistant, F-"
/clone_lib="Mouse 10kb plasmid UUGCIM library"
/note="Vector: PWD42IV; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources/documents/dnares/). The DNA
was bydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymuclectide kinase. Adaptor oligonuclectides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gfrom a derivative
of pWD42 (gfl |H732114|gpl |A1229072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (stratagene) cells
and selected for ampicillin resistance."
